FitBuddy

Brainstorming & Idea Prioritization

Project goal

Create a simple web app that turns a person?s fitness goal and preferences into a useful 7-day workout plan, then lets them refine it with feedback.

Brainstormed ideas

1. Personalized 7-day workout plan based on goal, age, weight, and intensity.
2. Clear daily workout details: warm-up, exercises, sets/reps, and recovery.
3. Feedback form to request changes and generate an updated plan.
4. Short goal-related nutrition or recovery tip.
5. Save user details and keep original and updated plans.
6. Coach/admin page to review users and their plans.
7. Mobile-friendly pages with simple forms and readable results.

Prioritization (1 = low, 5 = high)

Idea	Impact	Ease	Priority
Personalized workout plan	5	4	1
Feedback-based plan update	5	3	2
Save original and updated plans	4	4	3
Nutrition/recovery tip	3	5	4
Admin/coach overview	3	3	5
Mobile-friendly interface	4	4	6

Recommended MVP

Build first: input form, AI workout generation, plan display, and database saving.

Next: feedback-based updates and a nutrition tip. Add the admin view after the main user journey works.

Why this order?

The workout plan is the app?s main value. Saving plans enables follow-up changes. Feedback makes the plan personal over time. Tips add value at low effort; the admin page supports coaches but is not essential for the first user test.

Safety note: ask about limitations or injuries and remind users to adapt or stop if they feel pain. Keep health advice general and encourage professional guidance.

Based on the FitBuddy project brief supplied by the user.
