FitBuddy

Problem Statements

Project: AI Fitness Plan Generator using Gemini models

Core problem statement

People who want to improve fitness often struggle to turn broad goals into a realistic weekly routine. Generic plans may not match their experience, preferred effort, or changing needs, and users may not know how to adjust them.

FitBuddy will provide a personalized 7-day workout plan based on user-provided details and let users request practical changes through feedback.

Supporting problem statements

1. Difficulty getting started

Users may have a goal such as weight loss, muscle gain, or general wellness but lack a clear day-by-day plan. FitBuddy should organize workouts into simple steps.

2. Plans do not reflect individual preferences

A routine that ignores a user?s stated age, weight, goal, or preferred intensity may feel unsuitable. FitBuddy should use these inputs to tailor its suggestions.

3. Plans can become unsuitable over time

A user?s needs or preferences can change, but a fixed plan is difficult to adapt. FitBuddy should accept feedback and generate a revised plan.

4. Fitness planning lacks convenient guidance

Users may need a small nutrition or recovery reminder alongside exercise. FitBuddy should offer a concise, goal-related tip to complement the workout plan.

5. Coaches need a simple way to review plans

A coach overseeing several users may find it difficult to review saved plans in one place. FitBuddy should provide an admin view of users and their plan versions.

Primary users and intended outcome

Primary users: people seeking a basic personalized fitness routine; secondary users: coaches or administrators reviewing plans. The intended outcome is a clear starting plan that users can understand and refine. The app is a planning aid, not a medical assessment or a substitute for professional advice.

Based on the FitBuddy project brief supplied by the user.
