FitBuddy

Problem-Solution Map

How the proposed app features address the needs in the project brief

1. No clear starting routine

Problem: People with a fitness goal may not know what to do each day.
Solution: Generate a structured 7-day workout plan tailored to the stated goal, age, weight, and preferred intensity.

2. Generic plans may not fit the user

Problem: One-size-fits-all routines can feel too difficult, too easy, or irrelevant.
Solution: Collect basic user preferences and use them as context for plan generation.

3. Plans are difficult to adjust

Problem: User needs and preferences can change after they try the routine.
Solution: Let users submit feedback and generate a revised plan while retaining the original version for comparison.

4. Exercise advice lacks supporting guidance

Problem: A workout routine may not remind users about recovery or related habits.
Solution: Show a short goal-related nutrition or recovery tip with the workout plan.

5. Coaches need visibility across plans

Problem: A coach managing multiple users may need a consolidated way to review plans.
Solution: Provide a coach/admin page listing user details and original/updated plans, with access limited to authorized staff.

6. Complex interfaces can discourage use

Problem: Long forms and cluttered results make it harder to start and follow a plan.
Solution: Use a short input form, readable day-by-day results, and a clear feedback action.

Expected outcome

A user can enter basic details, receive a clear first plan, try it, and request a change. The product supports general fitness planning; it should communicate limits clearly, respect user ability, and not present AI output as medical advice.

Problem-solution ideas are based on the supplied FitBuddy project brief.
