FitBuddy

Project Execution Guide

How to set up, run, and demonstrate the FastAPI project locally

Prerequisites

Install Python 3, pip, and Git. Obtain a Gemini API key for AI features.
The project brief lists FastAPI, Uvicorn, Jinja2, SQLAlchemy, python-multipart, and the Google Generative AI SDK as dependencies.

Set up the project

1. Open a terminal in the project folder.

```
python -m venv venv
venv\Scripts\activate
pip install -r requirements.txt
```

On macOS/Linux, activate with: source venv/bin/activate
If no requirements.txt exists, install the dependencies listed in the project brief.

Configure the API key

Set GOOGLE_API_KEY in your environment or use a local .env file loaded by the app.
Never commit a real key to GitHub. Add .env to .gitignore.

```
GOOGLE_API_KEY=your_key_here
```

Start the application

Use the module path that matches your repository. The project brief gives examples:

```
uvicorn app.main:app --reload
uvicorn main:app --reload
```

Run only the command matching where the FastAPI app object is defined.

FitBuddy

Verify and Demonstrate

Open in a browser

`http://127.0.0.1:8000`	FitBuddy home page
`http://127.0.0.1:8000/docs`	FastAPI interactive API docs

Demo flow

1. Enter sample user details, a fitness goal, and workout intensity.
2. Generate and review the 7-day workout plan and nutrition/recovery tip.
3. Submit feedback such as adding cardio or extra rest days.
4. Show the updated plan and confirm the original plan remains saved.
5. Open the authorized admin view and review user/plan records.

Quick checks if something fails

Server will not start: confirm environment activation, dependencies, and app import path.
AI call fails: confirm API key, network access, and provider/model availability.
Template not found: confirm templates folder path and template filenames.
Database error: confirm SQLite path is writable and tables are initialized.

Before sharing

Check the public repository contains source, requirements, README, and phase documents.
Remove secrets and personal test data. Use synthetic details in the demo.
This guide explains local execution; it is not a compiled Windows executable.
